Abstract

Contiki an open source operating system for Wireless Sensor Networks (WSNs) and Internet of Things (IoT). It is the growing field in the technology and it is the evolution of the internet also known as network of network. Each objects, sensors, actuators and systems are networked and automated to provide new services which were not available before. Light weights, resource constraints, low cost motes are used in WSNs which leads to major challenges in security applications. Data collection are carried by sensors and computing can be done by sensor nodes itself or by external device. This paper focuses on the working of 6LoWPAN network using contiki tool with cooja simulator and various WSNs simulation tools are briefed. Paper also presents why contiki is used, its features and advantages of Cooja simulator. Cooja verify and debug the software and supports low power standards like 6Lowpan, coap, RPL in coniki. This work also focuses on data collection in rime with simulated results.

Index Terms- IoT, WSNs, Contiki, Cooja, 6LoWPAN, Rime, Simulator

1 INTRODUCTION

Contiki runs on a tiny low cost power microcontrollers and develop applications that make efficient use of the hardware while providing standardized low power wireless communication for the variety of hardware platform. [1] It is used both in various commercial and non commercial systems for example alarm systems, street lights, industrial monitoring, radiation monitoring, remote house monitoring, sound monitoring, site monitoring etc.[2][3]

Contiki has one of the important tool called cooja helps in development allow developers to test their code before running into target hardware. Cooja is a software simulator, it is open source, basically build in java, capable of executing C, C++ programs it is a network simulator designed for wireless sensor networks. Support fully standardized IPV6 and IPV4, support multiple platform such as Z1, Skymote, MicaZ etc.[4][5][6]. Simulations are used to verify the behavior of the system and debug their software. Hardware platform e.g. Skymote, Z1 mote etc. Contiki is used compile and upload program in mote. Different type of mote are Z1mote, Skymote, MicaZ ,ESB , Cooja, Wismote mote etc. [7][8][9][10].

ISBN: 978-81-936820-0-5

To compile and upload a program in to a mote. Target need to be set

```
make target=z1 programname
make programname.upload //(upload compiled program into a mote)
make login target=z1 //(login to view compiled code)
```

cd makefile : makefile is essential to compile harder program in cooja, it link essential files and build system to our program.

```
contiki=/home/user/Desktop/contiki-2.7 (linking contiki 2.7 folder)
include $(CONTIKI)/Makefile.include (including build system)
```

To update contiki OS
 cd contiki -2.7 cvc update -dp

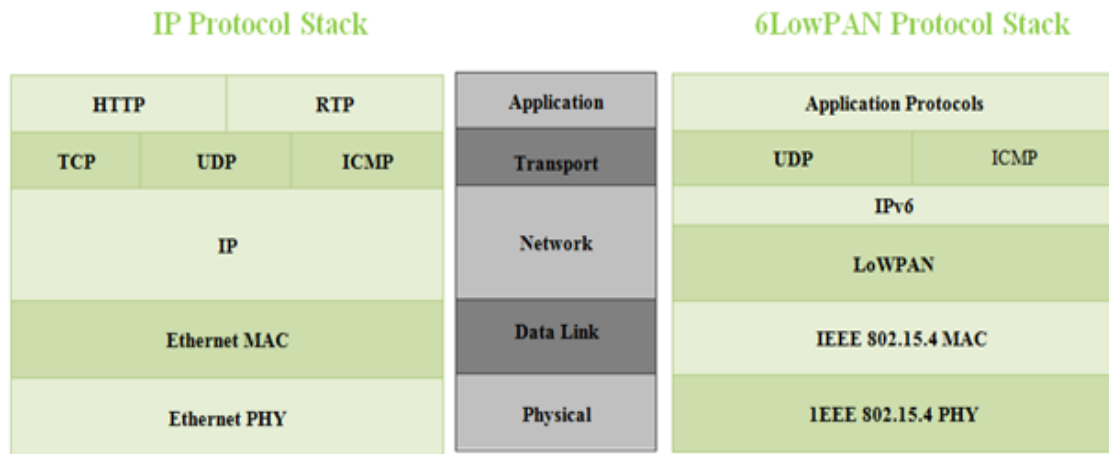

Fig 1.1: IP Protocol Stack, and 6LowPAN protocol stack [7]

IPv6 [11][12][13][14][15][16]

Pros

- No need of DHCP
- Support the multicasting against broadcasting
- Header is designed to reduce header overheads.
- Addresses supported is very large

Cons

- Challenging is deployment
- Expensive Multicasting
- Managing long addresses

Why 6LoWPAN? [17][18][19]

It Extends already existing IP Network, IPV6+LoWPAN (Lowpower RF), Simple Header Structure, Managed duty cycles for saving power , IP Networking End to End Light Weight i. e No full fledged TCP/IP stack and related complexity. In contiki we have multiple independent platforms such as cooja, sky, this is how we run hardware code in contiki.

2 FEATURES OF CONTIKI AND SIMULATION TOOLS IN WSN's

This section represents various simulation tools used in sensor networks and why contiki is used and its features. Simulator used for developing and testing protocols of WSN's. Simulation is performed in design stage. Execution time in simulation is very less and cost of simulating multiple nodes is very less. Below table represents various WSN simulation tools [8][9][10].

Table 2.1: WSNs Simulation Tools

Simulators	Features	OS	Merits	De-Merits	Platforms	License
NS-2	Real time network simulator	Linux, Windows	Protocols are publically available	Must be familiar with scripting language	C++	GPL
NS-3	Open environment for researchers	Linux windows	Not an extension to NS-1, new simulator	Supports only IPV4	C++, Python	GPL
OMNeT++	Less power consumption	Windows	Sophisticated graphical user interface	Compatibility Issues	C++	Commercial, Academic
MATLAB	Numerical computation, Visualization	Windows, Linux, macOS	Additional toolboxes, Graphical output.	High space complexity	C, C++, Java, Python	Open source
Contiki	Real time	VMware	Highly Portable, Multitasking	Resource constrained system	C	Open Source
Castalia	Sensing modeling provisions	Windows, Linux	Implementation of MAC protocols	Not a sensor specific platform	C++	Commercial, Academic
J-sim	Provide GUI library for animation, debugging and, tracing	Linux, Windows XP	Provide mobile networks and sensor networks	Low efficiency in simulation	Java	Commercial
QualNet	Provide scalability via supporting parallel execution	Solaris, Linux, Windows	Supports distributed computation in system	Expensive	C++	Commercial
TOSSIM	Easy to monitor packet traffic	Windows	Visualization tools are available	Compilation issues	NesC, C++, python	Open source

Why Contiki - It is open source OS for WSNs and IoT. It connects tiny low power, low cost microcontrollers to the internet, it is also powerful toolbox for building complex wireless

systems and it is used for both commercial and non commercial systems, no need to write code, full source code is available in one instant contiki download [11].

Internet Standards

Contiki works on low power, and provide internet standards. Supports IPv4 and IPv6 and low power wireless standards such as 6LoWPAN, CoaP, RPL. Contiki MAC and wireless routers can be battery operated.

Rapid Development

In Contiki development is fast and easy. Applications of contiki are written in C, Single download of Instant contiki provides an development environment. In Cooja simulator contiki networks is emulated before burned into hardware.

Hardware Selection

Contiki operate on a range of wireless device which is low power, these can be purchased easily in online so it supports selection of hardware.

Active Community Support

Contiki is developed by a team of world-wide developers with the contributions from Cisco, Atmel, Redwire LLC, ETH, Thingsquare, SAP, and many more developers led by Adam Dunkels of Thingsquare.

2.1 FEATURES OF CONTIKI

Contiki has huge features some of the features are briefed below [11]:

Dynamic Module Loading

Contiki performs Dynamic Module Loading and linking at run time. Module loader can load, relocate, and link standard ELF files that can optionally be stripped of their debugging symbols to keep their size down. This is useful in various applications where the behavior is intended to change after deploying it. Path is `contiki/core/loader/`

Cooja Network Simulator

It helps the programmers to see their applications run in large scale networks or in high detail on fully emulated hardware devices. Contiki devices build complex wireless network. So developing and debugging programs in such a network is difficult so cooja helps in providing simulation environment where developers can easily debug their software. Path is `Contiki/tools/cooja/`

Build Systems

It is simple to compile applications in contiki platform. It is easy to try out various applications on a variety of different platforms, even if the hardware is not available can perform the operations using the cooja simulator to emulate hardware devices. Path is `contiki/Makefile.include`.

Hardware Platforms

Contiki operates on a range of a Hardware platforms and it is easy to port to new hardware. Hardware platforms such as cc2538dk, exp5438, z1, wismote, sky, micaz, cooja, RE-mote etc.

Memory Footprint

Contiki run in very less amount of memory. IPv6 network need less than 10 k RAM and RPL routing needs less than 30 k ROM.

Regression Tests

In contiki code regression test is performed on cooja simulator so that contiki code work as expected. Test scripts is used in regression as a initial point for configuring up simulations or to investigate how various contiki mechanisms work. Code in `contiki/regression-test/`.

Contiki Shell

Contiki supports an optional command line-shell, which contain set of commands that are useful during code implementing and debugging in contiki systems. Shell commands are combined in a potent ways. Application defines their own shell commands that work with the existing commands. `Contiki/apps/shell/`

Protothreads

Contiki OS to save memory and to provide good control flow in the code it uses a mechanism, Known as protothreads, it is assortment of multi-threaded and event driven programming mechanisms. Event handlers can be made to block for events to occur. Code in `contiki/core/sys/pt.h`

Coffee Flash File System

Coffee is known as Lightweight flash file system. This file system application programs can perform various open, close, read from, write to, and append to files on the external flash, without having to worry about flash sectors needed to be erased before writing or flash wear-leveling. Performance of coffee is within 95% of the raw throughput of the flash memory. `Contiki/core/cfs/cfs-coffee.[ch]`.

Examples

There are various rich examples in contiki source code tree to help the beginners. Show program shows how to interact with the platform hardware, some programs show how to network code, and other program demonstrate the various aspects of contiki system and corresponding cooja simulator available. Can find the code in `contiki/examples/`.

3 EXPERIMENTAL RESULTS USING SIMULATOR

This section represents the working of 6Lowpan in contiki cooja simulator using hardware platform such as cooja, sky. This show running hardware code in contiki using cooja simulator.

Cooja has huge advantages some of them are listed below [7][15][18][19][20][21][22].

- It is an open source
- It has simple UI flexible, efficient, and scalable.
- Supports multiple platforms like sky mote, Z1mote, etc.,
- Support Native TCP/IP
- Uses basic C, C++ codes programming language.

- Supports Fully standardized IPv4 and IPv6.
- Supports low power standards like 6Lowpan, coap, RPL, etc.

6LoWPAN: Extends already existing IP Network, IPV6+LoWPAN (Lowpower RF), Simple Header Structure, IP Networking End to End Light Weight i.e No full fledge TCP/IP stack and related complexity and Managed duty cycles for saving power.

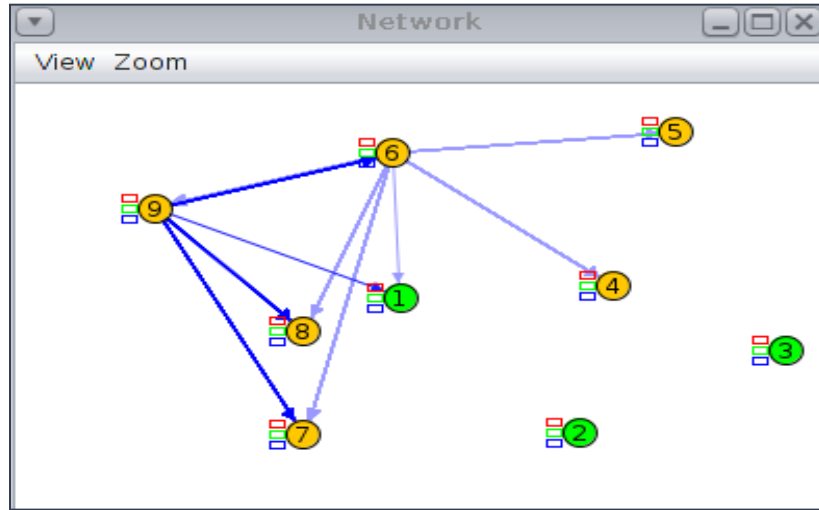

Fig 4.1: Displays Network window, consisting of 3 client motes and 6 sensor motes with LED and packets distribution to each nodes.

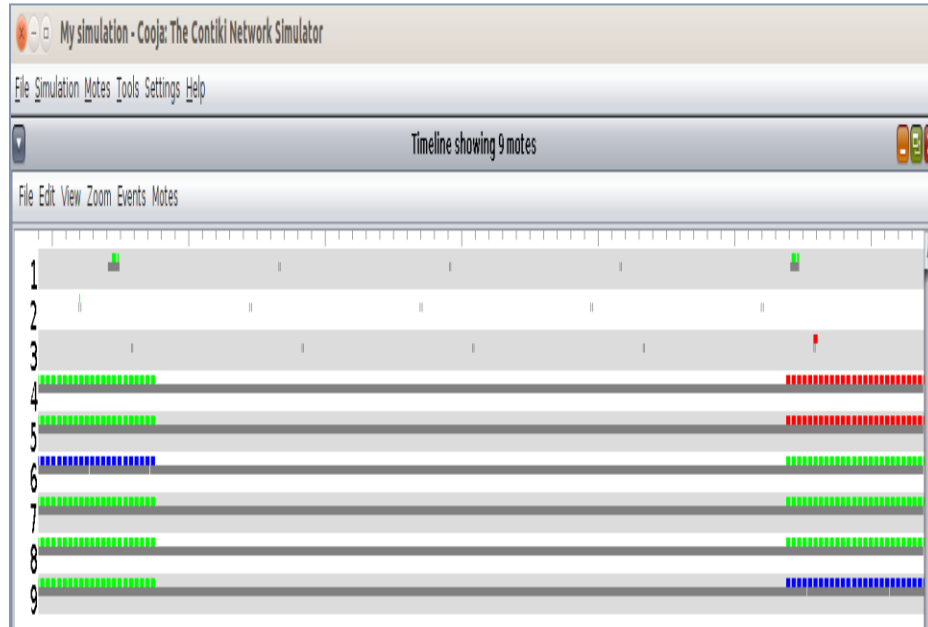

Fig 4.2: Displaying 9 Motes Timeline with different events like radio traffic, radio on/off, radio channel, LED colors, and radio events, black dots represents the radio events, red , blue and green line show the glow of correspondent LEDs lights on network window.

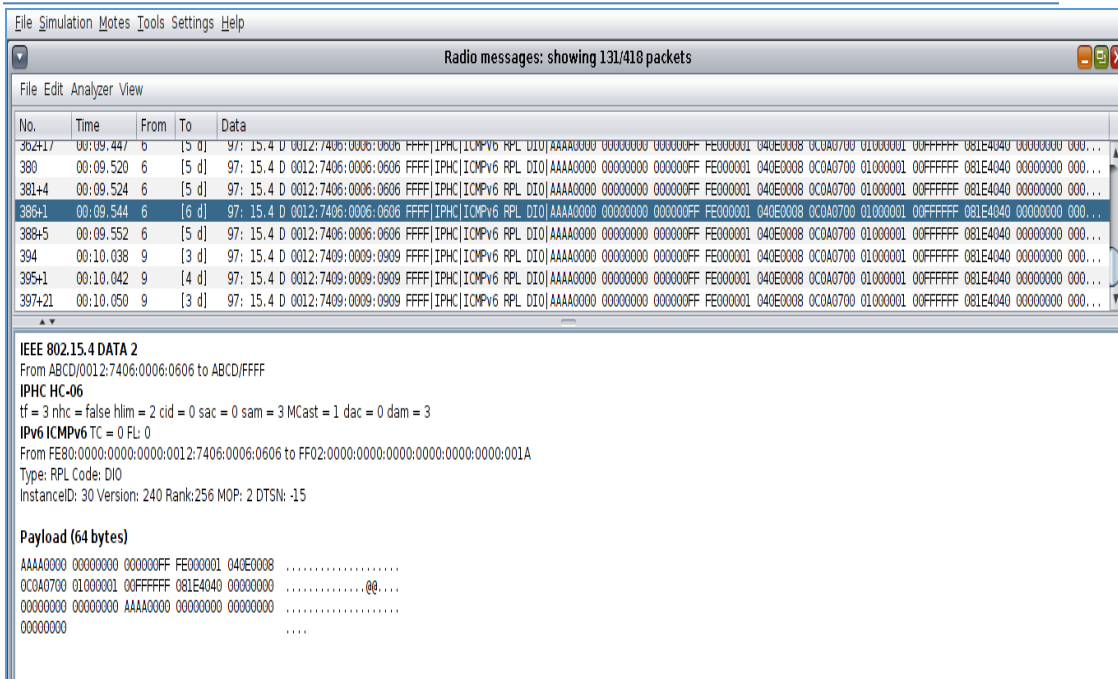

Fig 4.3: Displaying radio messages of 6LoWPAN packets, using 802.15.4 data in physical layer. IPv6 ICMPv6 means using 6LoWPan application with skymote.

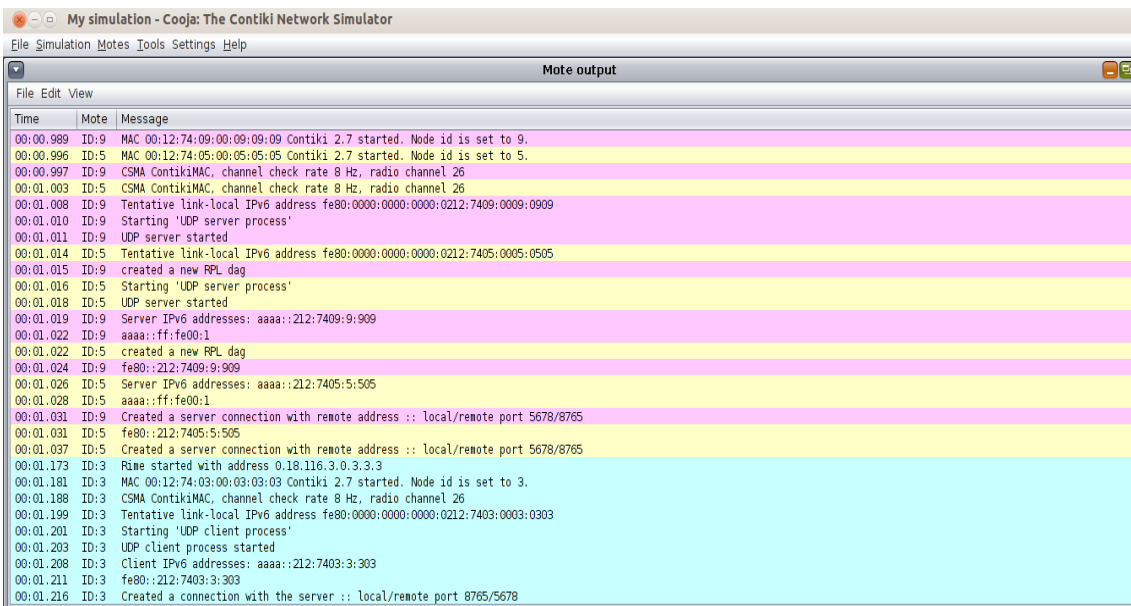

Fig 4.4: Motes console output initially, showing the time for each mote communication, mote ID, and Messages from one mote to another mote. Mote with ID-5 is a UDP server and ID-3 is a client. Client and server connection is established using local/remote port 5678/8765. ID- 1,2,3 are client, ID -4,5,6,7,8,9 are server.

Fig 4.5: Motes console output window prints results, transferring and receiving data 'Hello' in each Motes. ID 3 is the client sending data 'Hello 4' to ID 4. ID 4 is a server receiving data 'hello 4 from the client' 3.

Fig 4.6: Stack Watcher to identify stack push and pops and can monitor stack overflows

3.1 DATA COLLECTION WITH RIME [7]

Rime Stack is one of the feature of Contiki: For instant if bandwidth is at top or when the full IPV6 stack network is overload contiki uses rime, it is tailored wireless networking stack in contiki. It perform operation like sending a message to a specified neighbor or all neighbors, also support difficult mechanisms like network flooding and address free multi hop semi reliable scalable data collection. To save power it operates on sleepy routers. Code path is available in contiki/core/net/rime/.

Once the simulation is started we have different windows like network window, simulation control window, notes window, mote output window, timeline window.

- **Network Window:** Where we can deploy nodes and apply attributes to it. we can create mote by following steps Motes->Add motes->create new mote type->sky mote.
- **Simulation Control Window:** Control the particular simulation in the form start, pause, step and reload. Step to run the simulation for short interval of time that is 0.1 milli second, Reload helps to load the program automatically without having to do manually.
- **Notes Window:** Can take down important motes regarding particular simulation save.
- **Mote Output Window:** Display output of the simulation message passed between motes, if there is a base station it show how the messages of all node communicate to it.
- **Timeline Window:** Show how Simulation proceeds with respect to time in seconds

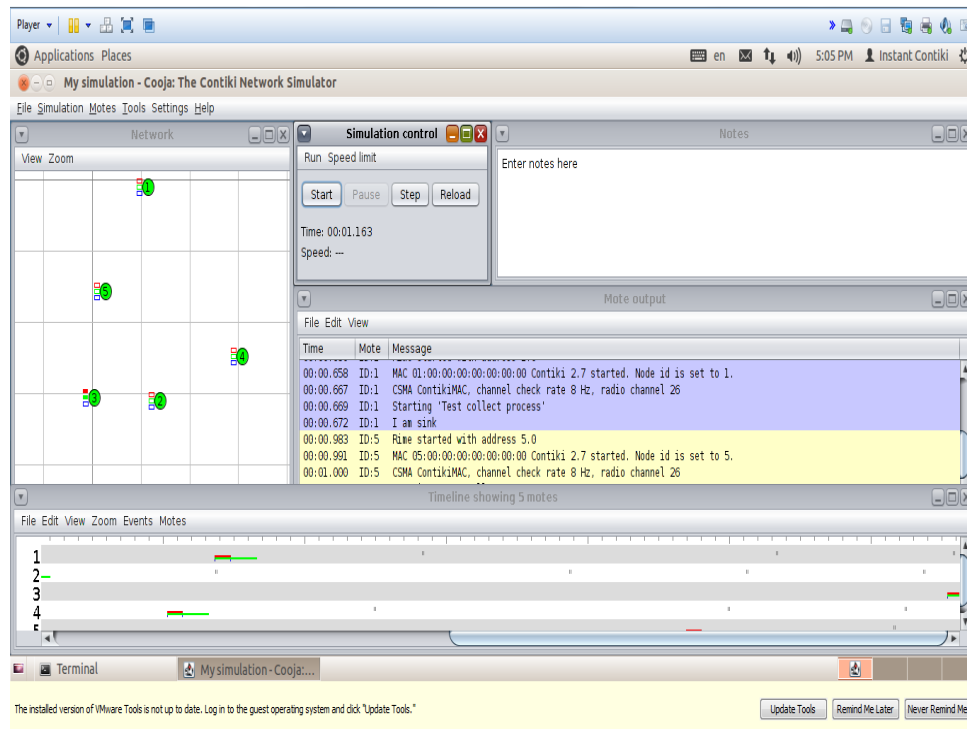

Fig 4.1.1: Deployment of motes in Network window, LEDs for each mote with background grid to manually position X and Y axis to these motes. As red line and green line is passed in timeline output, red and green LED gets lighted up in network window.

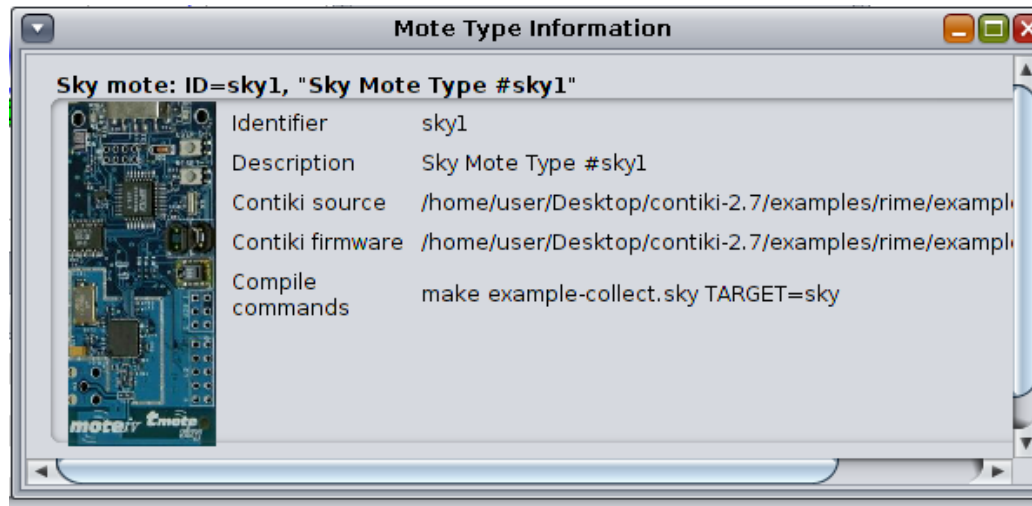

Fig 4.1.2: Description of the sky mote platform with sky mote ID ,sky mote type, identifier, contiki source, coniki firmware, and compiled commands TARGET=sky.

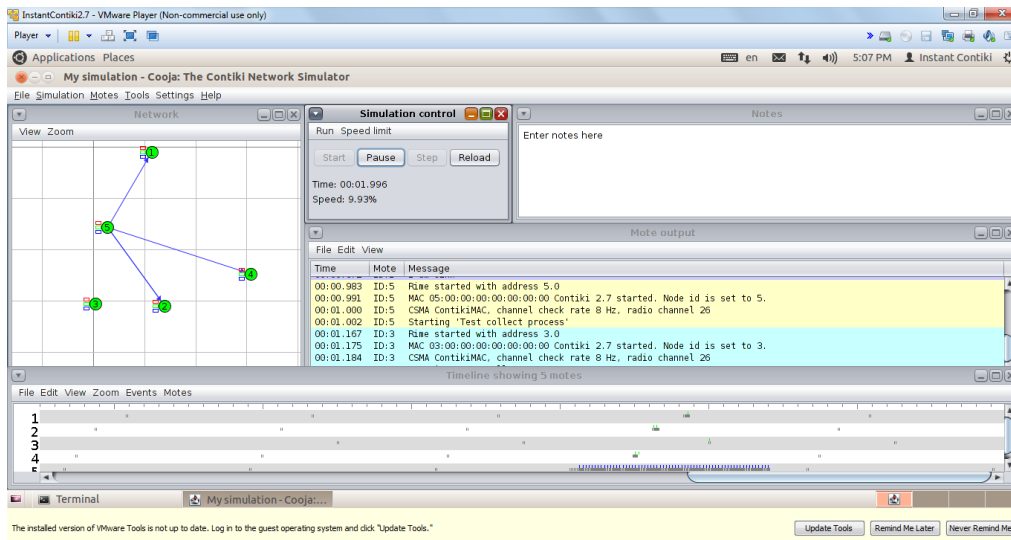

Fig 4.1.3: Packets simulation gets started in network window and correspondent message gets printed in mote output window, simulation can be controlled by simulation control output, and timeline show simulation with respect to time.

4 CONCLUSION

This paper focus on various simulator tools for WSNs. One of the tools in WSNs is contiki operating system used in domains like IoT and WSNs and used for real time application due to its real time it provide vast features to its users like rapid development, active community support, regression testing, dynamic module loading and linking, Memory footprint, and the

prime benefit in contiki is source code is available for beginners by instant contiki download and applications are written in C language. Contiki working is shown by using cooja simulator to compile and debug the software programs. Low power standards 6LoWPAN and working of Rime is showed using sky mote hardware platform using cooja simulator.
